In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all eight RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified CDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi, Fenton, Malatrasi). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and wing). Plasmid DNA perparations, DNA sequencing and sequence analysis were performed at CUGI (Wing) Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of chara, when the contains a minimum of 100 bases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EST 03-MAY-2004

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
division of Invitrogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleotide was
added by fill in the recessive 3' end The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
fractionated using sephadex. The resulting fragments were
fraction of 8 and 3 Xb and were cloned into the vector
(.x/y reads in M13mpl9, .b/g reads in pUC19). The same
ligation was transformed in either JM107 or DH5a. "

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gilf4[p1]14[p4]he129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

//note="Organ: trunks; Vector: pBluescript II KS(+);
//site_l: BcoRl; Site_2: Not!; This normalized library was
constructed from 1 million independent clones. cDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to Not! adapters, digested with
EcoRl, size-selected, and cloned into the Not! and EcoRl
compatible sites of a custom modified McS of the
pBluescript (KS+) vector: The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1995): 791, except that a significantly longer
reannealing hybridization was used."

/note="Organ: whole embryo; Vector: pBluescript II KS(+);
Site_1: BCORI; Site_2: Noti; Fils normalized library was
constructed from imilion independent clones. CDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand synthesis reaction.
Following this first strand caction, double-stranded CDNA
was blunted, ligated to Notl adapters, digosted with
ECORI, size-selected, and cloned into the Notl and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

// constructed for The Institute for Genomic Research by
// Bohui Zhao in Pieter do Jong's laboratory (Roswell Park
Cancer Institute, Buffalo, NY). Briefly, Trypanosoma
// brucei TREU927/4 GuTat 10.1 agarose embedded DNA was
// partially digested with a combination of Eco RI and Eco
methylase (RPC193-EcoRI segment) or Dpn II (RPC193-DpnII
// segment). High molecular weight fragments were ligated in
// paccelively. The average insert size is 141 KD. Total
days. Cells were induced six days after subculture" /clone lib="Elicited cell culture" /note="Vector: Lambda Zap; Cells were induced with yeast cell wall extracts equivalent to 50ug/ml glucose in the final concentration. Samples were taken at 0.5, 1, 12 and 24 hours after induction. Equal amounts of RNA from each time point were pooled and used for mRNA isolation."

Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (approx 2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999).

```
Substantial function. The cytoplasmic domain directs the function of the function receptor and is generally the cytoplasmic domain of a molecule which functions as a transducer of a mammalian immune response in the presence of an MRC (major histocompatibility complex)-peptide complex or costimulatory factor. Examples of cytoplasmic domains that may be costimulatory factor. Examples of cytoplasmic domains that may be invention in the present invention include the T-cell receptor gamma-chain cytoplasmic domain and the CD28 cytoplasmic domain. In a method of the invention, an expression vector encoding the fusion receptor is transduced into primary T-lymphocytes obtained from the patient to be treated. The transduced lymphocytes are returned to the patient where they secrete interleukin-2 (IL-2) and proliferate in response to PSMA-positive cells. The resulting cytotoxic lymphocytes specifically lyse cells expressing PSMA and can thus be used to target PSMA-positive tumour cells useful for the treatment of prostate cancer and other cancers that express PSMA. Sequences AAA10270 represent PCM primers used in an express PSMA. Sequences analysis of the present invention to amplify cancer that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a gene encoding a fusion

New fusion protein, useful for inducing host immune response, comprises variable region of light chain of an antibody linked to variable region of antibody, CD28 receptor signaling domain and transmembrane domain.

Example 3; Page 4; 9pp; English

The present sequence is that of a downstream primer, used with the

co thuman T cell surface receptor CD28 cDNA. The amplification of a segment of human T cell surface receptor CD28 cDNA. The amplified segment encodes correctly contained bacD28, and the transmembrane and the cytoplasmic domains. Plasmid pbsCD28 was used as template. The 5' primer cytoplasmic domains. Plasmid pbsCD28 was used as template. The 5' primer contains an Not1 site, while the 3' primer contains a BamHI site, and the trenviral vector SFG. A cell-surface molecule capable of CD28 signalling cretroviral vector SFG. A cell-surface molecule capable of CD28 signalling constructed. This comprised the antigon-binding site of a GD2-specific antibody and the transmembrane and signalling domains of the CD28 molecule. This is an example of fusion proteins of the invention comprising such fusion proteins exhibit enhanced survival when comprising such fusion proteins exhibit enhanced survival when response to cells, particularly tumour cells which express the anti-GD2 sefv are useful for treatment of melanomas, and head in contain and anti-GD2 sefv are useful for treatment of melanomas. ö neuroblastomas, small lung carcinoma, sarcomas and brain tumours that express GD2 as a surface antigen. Cells expressing the fusion proteins of the invention can also be used for in vitro purging of stem cells or bone marrow and for in vivo targeting of tumour cells and other antigen-Length 30; Sequence 30 BP; 6 A; 6 C; 11 G; 7 T; 0 U; 0 Other; Score 30; DB 6; Pred. New isolated immune response associated proteins (IRAP) polypeptide and

```
The invention relates to a novel isolated immune response associated protein (IRAP) comprising any of 35 fully defined sequences given in the specification. The polypeptide of the invention demonstrates antiarteriosclerotic, cytosciatic, neuroprotective, antiparkinsonian, hepatotropic, cerebroprotective, antinflammatory, nootropic and vasotropic activities and may be useful for treating a disease or condition associated with decreased expression or overexpression of functional immune response associated proteins, while the antibody is expression of IRAP, such as arteriosclerosis, cirrhosis, cancer, stroke, Alzheimer's disease, Parkinson's disease and Crohn's disease.
polynucleotide, useful for diagnosing and/or treating disorders with aberrant expression of IRAP, such as arteriosclerosis, cirrhosis, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        i independent cytotoxic T lymphocytes useful in tumour or viral therapy are activated by adhesion to antigen displaying cells.
                                                                                                                                                                                                                                                                                                      Furthermore, the molecules of the invention may be utilised during gene therapy procedures. The current sequence is that of a himan IRAP cDNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is a BamHI-SalI fragment encoding a chimeric receptor, composed of the extracellular region (XR) of CD2, fused via the transmembrane region (TM) of CD28 to the intracellular region (IC28)

cD28. TM and IC28 coding sequences of human CD28 (bp 556-767) are amplified by PCR from human CD28 cDNA, and the XR of CD2 (bp 1-627) is amplified by PCR from human CD2 cDNA. The sequences are closed to form Dlasmid pSKcytoCD28. The second of HYTR-CMV-Cat to form HYTR-CMV-Cat to packaging cell culture to give a stable PA317 cell line producing high titers of infectious retrovirus particles, which are then used to infect "-1ymphocytes. The resulting cytotoxic T-1ymphocytes (CTLS) are selectively activatable, and have a lessened dependence on helper T-1ymphocytes (TH cells) and/or growth factors. The chimeric receptor binds to the CD2 ligand (leukocyte function-associated antigen-3 or LRA-3), but 1028 transmits the proliferative signal of CD28. The CTLS mediate lysis of a target cell bearing a cognate antigen, and are useful in directed

The method comprises subcutaneous administration of an oligonucleotide (OGN). AAX9028 to AAX90291 represent specifically claimed OGNs for use in the method. The OGNs are used for the treatment of immune system-mediated diseases. The present sequence represents a DNA sequence of the human CD28 gene from the present invention

The library was screened for CD28 CDNA clones which were isolated using the antibody enrichment method (see e.g. AAQ21164 or AAQ21165). After the third transfection, COS cells were panned with a specific anti-CD28 Ab. A Hirt supernatant was generated and transfected into E.coli. DNA was prepared from the resulting colonies and transfected into COS cells. Surface expression of CD28 antigen was detected in 3 of the 8 transfected positives by indirect immunofluorescence. The cDNA insert from one of the gostilue clones was sequenced. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New CD53 cell surface antigen and DNA encoding it - for immuno-therapy and diagnosis of haematopoietic neoplasms, etc.

```
Antisense or triplex forming oligonucleotides which target sites within the present sequence, the CD28 cDNA, reduce T cell CD28 gene expression, useful in the treatment of CD28 mediated diseases, particularly immune system disorders, e.g. graft versus host disease, septic shock, viral disease, psoriasis, type I diabetes mellitus, thyroiditis, sarcoides, multiple sclerosis, uveitis, rheumatoid arthritis, systemic lupus erythematosus, inflammatory bowel disease, etc. Reducing CD28 expression may reduce the effects of antigenic stimulation of CD28 positive T cells, with a consequent reduction in cytokine release. This nucleotide sequence comprises human CD28 cDNA. The cDNA was isolated from HPB-ALL human T-cell tumour cells using a novel method for cloning convaint the memmalian expression libraries. The method is based on transient expression of an antigen in eukaryotic cells and physical selection of cells expression antigen by adhesion to an antibody-coated substrate. The method is useful for the isolation and molecular cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes cloning as such as CD1-53, ICAM, LFA-3, FCRIA, FCRIB, TLisA, and Leu8 (see AAW80440-55). CD28 polypeptide (see AAW80442) has been expressed in transfected COS cells. The purified genes and proteins are useful for immunodiagnostic and immunotherapeutic applications, including the disposses and treatment of immuno-mediated infections, diseases, and disorders of animals, including humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                obtd. by constructing an expression library in COS cells using cDNA decived from human T-cell tumnour line HPB-ALL and vector pit3M (see also AAT14705), and panning of the library using antibody-coated plates. This immunoselection cloning method, developed to clone genes for cell surface antigens of human lymphocytes (see also AAT14703.04 and AAT14706-26), has general appln. Cell surface antigens are obtd. for diagnostic and therapeutic use. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A cDNA clone (AAT14707) codes for human CD28 antigen (AAR91433). Human cell surface antigen CD28 cDNA.

19-DEC-2000 (first entry)

AAA50581;

φ

```
This nucleotide sequence comprises human CD28 cDNA. The cDNA was isolated from HPB-ALL human T-cell tumnour cells using a novel method for cloning cDNAs from mammalian expression libraries. The method is babyd or transient expression of an antigen in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for the isolation and molecular cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes surface membrane of a eukaryotic cell. It has been used to clone genes (see AAV81198-220) encoding cell surface antigens such as CD1a, CD1b, CD1c, CD2, CD5, CD7, CD13, CD14, CD16, CD19, CD20, CD2, CD26, CD27, CD44, CD53, ICAM, LFA-31, FerRia, FerRia, TRAIS and Leus (see AAW86188-62, AAW89151-52 and AAW80451). CD40 cDNA (see AAW81198) is specifically claimed. CD28 polypeptide (see AAW88451) has been expressed in
                                                                                                                                                                                                                                                                                                                                                                                  cDNA encoding human CD40 antigen - useful for cloning cDNA encoding cell surface antigens, constructing cDNA libraries, expressing vectors for expression in eukaryotic cells or their fragments.

                                                                                                                                                                                                                                                                                                                             (CSA) CD28 (See AAY96128). The CDNA was derived from a human T-cell tumour line HPB-ALL CDNA library using a new method for cloning CSA tumour line HPB-ALL cDNA library using a new method for cloning CSA colls. The method is based upon transient expression of CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate such as a culture dish. The predicted amino acid sequence of CD28 suggests an integral membrane protein with a single membrane-spanning hydrophobic domain terminating in a 41-amino acid cytoplasmic domain. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for diagnostic and immunotherapeutic applications, including the diagnosis and treatment of immune-mediated infections, diseases, and disorders in animals, including humans. These disorders include asthma,
                                                                                                                                                                                                                                                                                              The present sequence is that of cDNA encoding human cell surface antigen
Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasitic

```
The present sequence encodes human CD28 receptor. CD28 is a homodimeric glycoprotein involved in a secondary signalling pathway in the activation of T-cell proliferation. B7 on nerve cells can interact with CD28 on the immune cell leading to immune cell activation. The regulation of cell surface expression of MHC classII and co-stimulatory molecule B7 can be manipulated by regulating the intracellular dissipation of proton motor force which can be assessed in terms of mitochondrial membrane potential. These methods can be used for regulating cell growth and division to control disease processes by manipulating mitochondrial metabolism and the expression of cell surface immune proteins. They can be used for treating diseases associated with excessive cellular division, aberrant differentiation, and premature cellular death, e.g. cancers, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                            Use of cell surface and membrane characteristics for developing products for treating cancers, autoimmune diseases or neurodegenerative diseases.

The present sequence encoding for human lymphocyte cell surface antigen CD28 is used to obtain a new genetically engineered cDNA sequence encoding the CD28 amino acid extracellular domain sequence (amino acide in advortance) and on the comprising nucleotides 100-759, 154-555 or 134 given in AAU02437) and/or comprising nucleotides 100-759, 154-555 or 154-759 of the CD28 cDNA sequence. Various human lymphocyte cell surface antigen cDNA sequences (AAS03172, AAS03175, AAS03175, AAS03175, AAS03175, AAS03175, AAS03177, AAS03171, AAS03174) which provide high level expression vectors construction of cDNA libraries. Also described are 2 expression vectors (AAS03171, AAS03174) which provide high level expression in eukaryotic host cells. The purified genes and proteins are useful for immunodiagnostic and immunocherapeutic applications, such as in the disorders in animals and humans. Such diseases, infections or disorders and nimals and humans. Such diseases include immune deficiency diseases diseases of immediate type of hypersensitivity, asthma, hypersensitivity pneumonitis, systemic lupus erythematosus, rheumatoid other cell neoplasms, parasitic diseases, multiple sclerosis, Guillain-can also be used to identify, isolate and purify other antibodies and
New recombinant DNA encoding CD28 useful for diagnosing and treating immune-mediated diseases, infections or disorders, e.g. systemic lupus erythematosus, asthma, transplant rejection, rheumatoid arthritis.
                                                                                                                                                                                                                                              Example 3; Fig 7A-7B; 72pp; English.

```
The sequence represents the human CD28 gene. The invention relates to a covel method for inhibiting an immune response by administering an anti-convel method for inhibiting an immune response by administering an anti-convel method of the invention has immunosuppressive, contiguoriatic, antidiabetic, antiarthritic, antirheumatic, neuroprotective, dermatological, vasotropic, antiloflammatory, contianaemic, hepatotropic, antiulcer, antibacterial and ophthalmological activity. The method works to inhibit immune by reversing or blocking T cell activation. The method is useful for inhibiting an immune response in a subject susceptible to graft-versus-host disease (GVHD), continuous and the continuous continuous arbitish and immune contransplant rejection, or paving autoimmune disease including psoriasis, clambetes mellitus, multiple sclerosis, rheumatoid arbitis, systemic clupus erythematosus, systemic sclerosis, dermatomycaitis, polymyositis, polymyositis, polymyositis, polymyositis, polymyositis, autoimmune heapsis, and other autoimmune diseases including autoimmune heapsis, and other autoimmune diseases including autoimmune heapsitis, autoimmune haemolytic anaemia, Behcet's disease, contrains gravis, cirrhosis, uncerative colitis, and vitiligo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hybridisation complexes correlates with the presence of an immunopathological condition. Also disclosed are an expression profile compliant condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a method for identifying a plurality of polymucleotide probes. The CDNAs are useful as hybridisable array elements in a microarray for monitoring the expression of target polymucleotides. The microarray can be used in the diagnosis of an immunopathology, such as Crohn's disease, asthma, osteoarthitis, hyperresinophilia, irritable bowel syndrome, osteoarthitis, rheumatoid arthritis or acute monocytic leukaemia, and in identifying agents for the treatment of the diseases. The microarray may
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or comprising the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under conditions to form one or more hybridisation complexes and comparing the levels of the detected hybridisation complexes with the level of hybridisation complexes
                                                                                                                                                                                                                                                                                                                             A composition comprising a plurality of cDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                s patent did not form part of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 also be used in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition may also be used in purification of a subpopulation of mRNAs, cDNAs or genomic fragments. This sequence represents a human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The sequence is an Xbal-Sall fragment encoding a chimeric receptor, composed of the extracellular region (XR) of leukocyte function-sesociated antigen-1 beta-chain (LFA-1-beta, of the integrin family), fused via the transmembrane region (TM) of CD28 to the integrin family), caused via the transmembrane region (TM) of CD28 to the interacellular region (IC28) of CD28. TM and IC28 coding sequences (bp 556-767) are amplified by PCR from human DD28 cDNA, and thex Rx coding sequences are cloned to form plasmid pSKLFA-1-beta/CD28, and subcloned in HyTK-CMV-Cat cloned to form plasmid pSKLFA-1-beta/CD28, and subcloned in HyTK-CMV-Cat into a psi-2 ecotropic packaging cell culture to give a stable PA317 cell into producing high titers of infectious particles, which are then used to infect T-lymphocytes. The resulting cytotoxic T-lymphocytes (CTLs) are selectively activatable, and have a lessened dependence on helper T-C lymphocytes (TH cells) and/or growth factors. The chimmeric receptor binds to the LFA-1 ligand (intercellular adheaion molecule-1, ICAM-1 or CD54) but IC28 transmits the proliferative signal of CD28. The CTB4 in directed cancer immunotherapy, and in treatment of viral infections
                                                                                                                                                                                                                                                                                                                                               i independent cytotoxic T lymphocytes useful in tumour or viral therapy are activated by adhesion to antigen displaying cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transmembrane region; intracellular domain; retrovirus; vector; packaging cell culture; gene transfer; ICAM-1; selective activation; cytotoxic T-lymphocyte; antitumour; immunotherapy; cancer; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is used for cloning into a vector which transforms COS cells. The vectors can be used to isolate any protein by immunoselection, and clones are easy to manipulate. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                       The sequence is an XDaI-KpnI fragment encoding a chimeric receptor, composed of the extracellular region (XR) of leukocyte function-associated antigen-1 alpha-chain (LFA-1-alpha, of the integrin family), fused via the transmembrane region (TD28 to the intracellular region (IC28) of CD28. TM and IC28 coding sequences (bp 556-767) are amplified by PCR from human CD28 cDNA, and the XR coding sequence (bp 1-358) is amplified by PCR from human LFA-1-alpha (DD28. This retrovirus vector is cloned to form plasmid pSKLFA-1- alpha/CD28, This retrovirus vector is introduced into a psi-2 ecotropic packaging cell culture to give a stable PA317 cell line producing high titers of infectious particles, which are nused to infect T-lymphocytes. The resulting cytotoxic T-lymphocytes (CTLs) are selectively activatable, and have a lessened dependence on helper T-lymphocytes (TH cells) and/or growth factors. The chimeric receptor binds to the LFA-1 ligand (intercellular adhesion molecule-1, CTLs mediate lysis of a target cell bearing a cognate antigen, and are used to undered concer immunotherapy, and in treatment of viral

```
The present invention relates to a method of therapeutically downmodulating an autoimmune response or an ongoing autoimmune response, comprishing administering an antigen binding portion of an anti-CD28 antibody that blocks signaling via CD28 to the subject so that an autoimmune response or an ongoing autoimmune response in the subject is downmodulated. The methods are useful in therapeutically and prophylactically downmodulating the immune response in subjects having autoimmune disorders such as diabetes, allergy and allergic reactions, transplantation rejection, graft versus host disease, systemic lupus erythematosus, rheumatoid arthritis, mysathenia gravis, autoimmune thyroiditis, vitiligo, alopecia, inflammatory bowel disease, Addison's disease, draves disease, haemolytic anaemia and Sjogren's syndrome. The present sequence is the human CD28 coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             r-cell; cell proliferation; cell survival; cytostatic; antiallergic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;
                                                                                                                                                                              to T-cell proliferation, or T-cell proliferation relative to T-cell survival. The method involves contacting a T-cell expressing a CD28 protein with an agent that selectively modulates the activity of a CD28 survival or proliferation motif relative to the activity of a CD28 proliferation motif respectively, to selectively modulate survival or proliferation of the T-cell. The method is useful in selectively modulating survival or proliferation of the T-cell. The method is useful in a subject. The method may also be used to prevent or treat disorders associated with associated disorders, allergic diseases, transplant-associated disorders, allergic diseases, graft-versus-host disease, lymphoproliferative disorders or autoimmune diseases. The present sequence represents a DNA encoding the human CD28 protein
                                                                                                                                                                       invention relates to selectively modulating T-cell survival relative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, carcinoma associated, oncogene, carcinoma, cancer, breast, prostate, lymphoma, leukaemia, cytostatic, gene therapy, drug screening,
                                                                                        Selectively modulating T-cell survival or proliferation, useful for treating autoimmune diseases, comprises contacting T-cells expressing DD8 protein with agents that modulate activity of CD28 survival or proliferation motif.
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to crecombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a cinvention also encompasses expression vectors and host cells comprising a comprising to the protein, and a blochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retrovirues, which insert into the genome of the host organism or a random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or carcinoma (especially breast cancer, prostate cancer, lymphoma or carcinoma (especially breast cancer, prostate cancer, lymphoma or tissues. CA nucleic acids, proteins and antibodies are also useful as therespettic agents and in screening and expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as thereapeutic agents and in screening and evaluating drug candidates. The present sequence of the printion. Note: The complete sequence data for this cancer in electronic format didectly from WIPO at an electronic format didectly from WIPO at electronic format didectly from WIPO at electronic format didectly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant nucleic acid, useful for treating carcinomas, lymphomas

Cytostatic; gene therapy; vaccine; cancer; carcinoma-associated gene; CA; secreted; transmembrane; intracellular; ds.
                           The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynuclectide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and
                                                                                                                                                                                                                                                           sarcomas. The present sequence represents a human mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant nucleic acid comprising a nucleotide sequence of any of
the carcinoma-associated (CA) genes, useful for screening for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nuclectide sequence selected from any of the fully defined carcinoma-
associated (CA) genes from the 50 tables given in the specification. The
CA proteins are secreted, transmembrane or intracellular proteins. The
recombinant nucleic acids are useful for screening for drug candidates
for diagnosing or treating carcinomas. Sequences given in ADC85215-
ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a recombinant nucleic acid comprising a

The invention relates to new recombinant nucleic acids. The invention also relates to a host cell comprising a recombinant nucleic acid of also relates to a host cell comprising a recombinant nucleic acid, a recombinant protein, a method of screening for drug candidates, a method of screening for a bioactive agent capable of binding to a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma drug, a method of diagnosing carcinoma, a method of inhibiting carcinoma drug, a method of diagnosing carcinoma, a method of diagnosing carcinoma, a method of carcinoma and comprises administering the effect of a candidate carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprising the nucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of consor more genes comprising the nucleic acid sequence in a first tissue trype for a first individual and comparing the expression of the gene from a second normal tissue type from the first individual or a second normal tissue type from the first individual or a second carcinomas comprises diading an inhibitor to the CAP. Treating carcinomas comprises administering to a patient an inhibitor of CAP. Neutralising the effect of a CAP comprises contacting an agent specific for the CAP. The polypeptide specifically binds to the protein encoded by the nucleic acid. The nucleic acid of the invention. Note: The sequence corpusions or lymphoma. This sequence represents a human carcinoma corpusions or lymphoma. This sequence represents a busing captained in electronic format directly from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.

The invention relates to a construct for downmodulating immune response in a subject. The construct comprises an exposed surface attached with an attigen-binding portion of an antibody that binds to a cytotoxic T lymphocytic antigen (CTLA) -4 or CD28 expressed on T-cell of the subject, and a major histocompatibility complex (MHC) molecule. The construct is useful for treating an individual afflicted with a disease or disorder that would benefit from downregulation of immune response. Downmodulation of the immune response is useful to downmodulate the immune response in autorimmune diseases such as systemic lupus erythematosus and multiple sclerosis. The construct is useful for inhibiting immune cell activation and prevents production of autoantibodies or cytokines which may be involved in disease production of immune cell activation is useful in the treatment of allergy and allergic reactions of the construct is also useful in viral immunity or in immunodeficiency diseases cuch as AIDS and DiGeorge Syndrome. Induction/enhancement of immune cell function results in increased tumour destruction in cancer patients. The construct is also useful in treating infectious diseases. The present sequence is human CD28 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (GEMY ) GENETICS INST INC.
```

```
The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03994), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a invention also encompasses expression vectors and host cells comprising a carcinoma also encompasses expression vectors and host cells comprising a carcinoma blocker. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism car random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protoconcogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or a propensity to carcinoma by determination of the sequence carcinoma (especially breast cancer, prostate cancer, lymphoma or tissues. CA nucleic acids, proteins and antibodies are also useful as therement sequence represents a specifically claimed human CA nucleic acid format did not form part of the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                              activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a human gene of the invention.
                                                                                                                                                                                                                                                                                                                                                   New recombinant nucleic acid, useful for treating carcinomas, lymphomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 51365 BP; 15176 A; 10059 C; 10474 G; 15656 T; 0 U; 0 Other;

The invention also relates to a host cell comprising a recombinant nucleic acid or expression vector, an expression vector comprising a recombinant nucleic acid, a recombinant protein, a method of screening for drug candidates, a method of screening for a bioactive agent capable of binding to a
                                                                                                                                                                                                                                                                                                                                                                                                                        The
                                                                                                                                                       New recombinant nucleic acid comprising a nucleotide sequence of any of the carcinoma-associated (CA) genes, useful for screening for drug
                                                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinoma-associated (CA) genes from the 50 tables given in the specification. The A proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, carcinoma associated nucleic acid, CA nucleic acid, gene, ds, carcinoma associated protein, CAP, carcinoma, leukaemia, lymphoma,

method of screening for a bloative agent capable of modulating the activity of a CAP, a method of evaluating the effect of a candidate carcinoma drug, a method of evaluating the effect of a candidate carcinoma drug, a method of diagnosing carcinoma, a method of the activity of a CAP, a method of treating carcinoma, a method of the activity of a CAP, a method of treating carcinoma, a method of the activity of a CAP, a method of treating carcinoma, a method of carcinoma drug comprises administering the effect of a candidate carcinoma drug comprises administering the drug to a patient, removing a cell sample from the patient and determining alterations in the expression or activation of a gene comprising the nucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of the gene comprising the nucleic acid sequence in a first tissue type from the first individual and comparing the expression of the gene from a second normal tissue type from the first individual or a second activity of a CAP comprises binding an inhibitor to the CAP. Treating carcinoma a method of inhibiting the carcinomas comprises administering to a patient an inhibitor of CAP. Observable of the invention and a composition for diagnosing or treating carcinoma e.g., the nucleic acid. It comprises an antibody that specifically binds to the protein encoded by the nucleic acid. The nucleic acids are useful for protein encoded by the nucleic acid. The nucleic acids are useful for protein encoded by the nucleic acid of the invention. Note: The sequence data associated (CA) nucleic acid of the invention. Note: The sequence data composition format directly from USPTO at

                                                                                                                  ð
                                                                                                                                                                                                ö
                       The invention relates to a nucleic acid polymer encoding a chimeric T cell receptor (TCR) which comprises human CD3 zeta chain intracellular domain, a co-stimulatory signalling region and a binding element that specifically interacts with a selected target. The methods and compositions of the invention are useful for treating disorders where the imamue response needs to be induced, such as cancer. The present sequence is a PCR primer used to amplify human CD28 costimulatory molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel tumor-associated antigen recognized by murine monoclonal antibody 8H9, expressed on cell membranes of broad spectrum of tumors, useful for producing antibodies capable of inhibiting tumor cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a protein (I), in particular tumourassociated antigen 58 kilo Daltons (kDa) in molecular weight, reacting specifically with monoclonal antibody (MAD) 8H9 Also described: (1) a composition (C) comprising MAD 8H9 or its derivative; (2) an antibody produced by immunising (I) or its specific portion; and (3) an antibody (II) produced by using (I). (I) has antitumour activity and can be used in antibody-based therapy. (I) can be used for producing a MAD, and to evaluate the tumour bearing potential of a subject, by measuring the expression of 8H9 antigen in the subject, where an increased expression of the antigen indicates higher tumour bearing potential of the subject. (II) or (C) comprising 8H9 or its derivative are useful for inhibiting the growth of tumour cells in vitro or in vivo, and the antibody indirectly coupled to a cytotoxic agent (radioisotope) is useful for
                                                                                                                                                                                              Gaps

incorporating an Xhol restriction site. It was used with primer 3555 sense primer (see ACF80095) in the PCR amplification of an hCD8a leader-849 scFV-CD8 construct. The construct was used in a series of experiments in which an anti-idiotype antibody was used to enhance ScFV chimeric immune receptor gene transduction and clonal expansion of human lymphocytes. The invention provides a composition comprising 8H9 or its derivative, such as an scFV or ScFV-FC, and a suitable carrier. The antibody may comprise the CDRs of 8H9 with its remaining sequence being human. Also claimed are nucleic acids encoding the antibodies, vectors, cells comprising the vectors, and methods of producing the antibodies. The method for directly killing or delivering a drug, DNA or RNA to cells bearing the antigen using an 8H9 ScFV or a 8H9-ScFV-modified cell or inhibiting the growth of tumour of the antipod of tumour bearing potential of a subject, or (when coupled to a cytotoxic agent) reducing tumour cells, imaging a tumour, evaluating the cumour cells in the subject, or (when coupled to a cytotoxic agent) reducing tumour cells
                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition comprising the monoclonal antibody 8H9 useful for reducing tumor cells in a subject, evaluating the tumor bearing potential of a subject or screening new anti-tumor compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Monoclonal antibody; 8H9; antitumour; cytostatic; gene therapy; human;

Primer P3241 was used with primer P3240 (see AAT90525) in the PCR cloning of the human CD28 transmembrane and intracellular components using human leukocyte cDNA as template. P3241 introduces a 3' EcoRI site and P3240 introduces a 5' BamHI site. The PCR product was subcloned into pBluescript SK+ to form a CD28 cassette. Primer P3241 was also used with primer S0146 (see AAT90533) to produce a hinge-CD28 cassette. These cassettes can be utilised in novel chimeric genes (see AAT90510-11 and AAT90513-14) encoding recombinant chimeric receptors (see AAM2647-48 and AAW36650-51) useful in cell activation processes, e.g. for the treatment

The method is useful for making a single chain antibody directed against an antigen. PCR primers ACC70421.22 were used to construct a chimeric immune receptor, comprising the human CD8a leader, a scFv and CD28

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed cartivity of (II) or to treat disease states involving (II). (II) is activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The colypeptide and polymucleotide sequences have applications in diagnostics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess Claim 1; SEQ ID NO 17370; 103pp; English. 30-MAR-2001; 2001WO-US008631. 31-MAR-2000; 2000US-00540217. 23-AUG-2000; 2000US-00649167. Claim 6; SEQ ID NO 2739; 899pp; English

gene expression

```
comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

                                                                                                                                                                                                                                                                                                                                                                                                 Primers P3301, P3302, P3303, P3304, P3305 and P3306 (see AAT90527-32) were used for the PCR assembly of a human T cell receptor zeta-CD28 fusion cassette. The 3' end of zeta, starting at the native Styl site, and the intracellular component of human CD28 were PCR assembled such that the zeta stop codon was removed and an in-frame fusion protein would be translated. The PCR product was subcloned into pBluescript SK+ containing a CTMO1 TCR zeta chimeric receptor construct, replacing the 3' end of zeta. The zeta-CD28 fusion cassette can be utilised in novel chimeric genes (see AAT90510 and AAT90513) encoding recombinant chimeric receptors (see AAW26647 and AAW26650) useful in cell activation
                                                                                                                                                                                 New DNA systems for activating cells - comprising DNA coding for a chimeric receptor comprising 2 or more different cytoplasmic signalling

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

GENERAL INFORMATION:

APPLICANT: FELDHAUS, ANDREW L.

APPLICANT: PELDHAUS, LORI A.

TITLE OF INVENTION: CHIMMERIC RECEPTORS FOR THE GENERATION OF

TITLE OF INVENTION: SELECTIVITY-ACTIVATABLE T(h)-INDEPENDENT CYTOTOXIC T CELLS

TITLE OF INVENTION: SELECTIVITY-ACTIVATABLE T(h)-INDEPENDENT CYTOTOXIC T CELLS

TITLE OF INVENTION: SELECTIVITY-ACTIVATABLE T(h)-INDEPENDENT CYTOTOXIC T CELLS

TORRESPONDENCE ADDRESS:

ADDRESSEE: MORRISON & POERSTER

STRET: 755 PAGE MILL ROAD

CITY: PALO ALTO
